

# **Session 7:**

# **Strings in C**

**TeachToTech**

## What is a String in C?

In C, a string is an array of characters that ends with a null character '\0'.

This null character tells the program where the string ends.

**string str = "Geeks"**

index → 0 1 2 3 4 5

str → G e e k s \0

## **Why Strings are Important**

Used to store names, messages, text data  
Essential for user input/output  
Core of file handling, searching, and text processing

# String Declaration

Defining:

```
char str[20];
```

Initialization:

```
char str[] = "Hello";
```

Internally:

```
{'H','e','l','l','o','\0'}
```

# String Input & Output

```
scanf("%s", str);  
printf("%s", str);
```

⚠️ `scanf` stops at space.

## Reading a Full Line

```
fgets(str, sizeof(str), stdin);
```

# Built-in String Functions

Common functions:

- `strlen()`
- `strcpy()`
- `strcmp()`
- `strcat()`

→ **But** →

All starts With

Include header:

```
#include <string.h>
```

## **strlen() - Length of String**

```
int len = strlen(str);
```

**strcpy()** -  
**Copy String**

```
strcpy(dest, src);
```

## **strcmp() -** **Compare Strings**

- $0 \rightarrow$  equal
- $<0 \rightarrow \text{str1} < \text{str2}$
- $>0 \rightarrow \text{str1} > \text{str2}$

```
int res = strcmp(str1, str2);
```

## **strcat()** - **Concatenate Strings**

Appends str2 to str1.

```
strcat(str1, str2);
```

## **Reverse String (Logic Based)**

```
int i = 0, j = strlen(str)-1;  
while(i < j){  
    char temp = str[i];  
    str[i] = str[j];  
    str[j] = temp;  
    i++;  
    j--;  
}
```

## Remove Outermost Parentheses (Concept)

- Use a counter to track depth
- Ignore first ( and last ) of each primitive substring

### Activity

Copy one string to another without using `strcpy()`

```
int i = 0;  
while(src[i] != '\0') {  
    dest[i] = src[i];  
    i++;  
}  
dest[i] = '\0';
```

# Summary

- Strings are character arrays
- Null character defines string end
- Built-in functions simplify operations
- Essential for real-world applications
